

# Towards categorizing ethical questions in data literacy

## Results of a focus groups study at the NFDI4Ing conference 2022

**Abstract.** Data Literacy is crucial for a sustainable engineering education. In aiming to find solutions to solve future challenges, mechanical engineering has started to integrate data literacy into the higher education curriculum. However, in current frameworks ethics are seen as a side topic or are equated to data privacy issues. Since literacy aims to empower people to make informed decisions based on their or other data, the development of critical reflection and discussion on ethics is central for data literacy. Those frameworks who do address ethics often remain general in their examples. In our contribution, we aim to add ethical questions that data scientist face in their work with data. Therefore, we will first summarize current existing data literacy frameworks and their ethics concept. Then, through a focus group study among data literacy experts' we collect ethical and categorized questions. The study was conducted with 15 experts at the NFDI4Ing Conference 2022. This approach expands examples in ethics for data literacy beyond data privacy towards applied, current and pressing ethical questions.

## 1 Introduction

Describing a 'set of abilities around the use of data as part of everyday thinking and reasoning for solving real-world problems' [1], data literacy is key for an increasingly digital and data driven society [2]. Along with the ability to solve real-world problems with the use of data, the critical reflection with data is becoming increasingly important [3]. Moreover, there are many risks of incorrect assumptions based on data that might lead to incorrect knowledge and decisions. This then might further fuels biases in societies. There is a responsibility for those communicating through data to inadvertently reduce biases [1].

Ethics is a moral philosophy that aims to systematize, defend, and recommend concepts of right and wrong behavior and action [4] [5]. This often results in extensive discussions of complex, interdisciplinary and ambiguous questions – especially in an increasing dynamic and complex global society. To become agent in their decision making, ethical guidelines based on democratic values had been introduced in different literacies such as media literacy [6] and AI literacy [7]. As the relevance of data increased along with the difficulty for human beings to comprehend the influence on our knowledge and decision-making, ethics need to be further considered in the data literacy frameworks.

17 Ethical considerations should not be understood as a side subject to be taught with many others,  
18 Ethical questions in data literacy are a core element and basis for all subsequent decision making.  
19 Especially competencies that consider critical thinking and enabling agency are barely mentioned  
20 in current data literacy frameworks. As the relevance of data increased along with the difficulty  
21 for human beings to comprehend and process, the influence to our knowledge culture should be  
22 further considered in the frameworks.

23 While there are already concepts on teaching ethics in data literacy [8]. However, when training  
24 ethics in data literacy those examples are less from actual daily work but from social media  
25 interaction [9]. To prepare future workforce for ethical decision making through data, the  
26 examples given should be realistic and actual examples that professionals working with data  
27 experience.

28 Indeed, many literacy discussions consider ethical discussions as important for supporting  
29 empowered citizens [10] [6] [9]. Still, when applying ethics in the curricular topics of data  
30 literacy, they are often pushed to the side in favour of more applicable topics such as data  
31 visualisation, data analytic or data tasting. The objective of this contribution is to invite data  
32 scientist and mechanical engineers to reflect on ethical question in their work with data and  
33 collect those questions into actual ethical question that arise in daily business. The research  
34 question is therefore:

- 35 • What ethical questions are present with data experts and should therefore be addressed  
36 and considered as examples, when applying data literacy frameworks?

37 The first part of this contribution will highlight ethics concepts in existing data literacy frame-  
38 works. The following part will introduce a focus group study as a explorative method to collect  
39 ethical issues in the interaction with data. The focus group study took place among data literacy  
40 experts at the NFDI4Ing conference in November 2022. The different ethical questions are  
41 summarized to identify key ethical categories that should to be included in ethics discussions  
42 on data literacy. Finally, the conclusion will open further potential research questions in data  
43 literacy and give examples for addressing ethical questions in daily practice with data.

## 44 2 The role of ethics in data literacy frameworks

45 Contrary to its importance in decision making, ethics remain a minor course within data literacy.  
46 They rarely play the central role that is required. Most of the current frameworks that do consider  
47 data ethics as important then lack concrete applicable topics in their curricula. They rarely  
48 are concrete and give hints to educators on how exactly they can apply ethics in data literacy  
49 programs.

50 For example, Heidrich et al. introduce ethics as a side competency in their framework [11].  
51 In the study from Wolff et al., they identify through card sorting that professionals see ethical  
52 competence as highly relevant within data literacy, but do not give further examples on what  
53 asked professionals understand by this [1]. Card sorting is a user research technique used to help  
54 evaluate the information by having participants organize topics into categories that make sense  
55 to them. In Grillenberges and Romeikes approach to create a data literacy Competency Model  
56 based of Risdale et al., they introduce their competencies along the data management cycle and

57 divide them into process and content-oriented competencies [12]. They introduce a layer called  
58 ethics, but do not connect it visibly with the introduced competencies or exemplify it. Schüller  
59 et al. introduce a comprehensive data literacy framework considering both comprehensive and  
60 selective competencies along a data value chain [10]. In their model ethics is pushed to the side  
61 of the framework and is seen as a separate ethics literacy.

62 A general guideline for data processing can be understood in the FAIR principles that emphasize  
63 the importance of making data Findable, Accessible, Interoperable, and Reusable[13]. The  
64 FAIR principles were introduced by the FORCE11 community and function as a framework  
65 to ensure that scientific data is managed in a way that maximizes its utility and impact (FAIR)  
66 [14]. They were introduced by and function as essential criteria for data stewardship, aiming to  
67 enhance the ability of machines to automatically find and use data, in addition to supporting its  
68 reuse by individuals.[14] However, implementing these principles can be challenging due to the  
69 diverse and complex nature of data and metadata standards across different disciplines, requiring  
70 significant effort in data curation and management to fully achieve FAIR compliance.

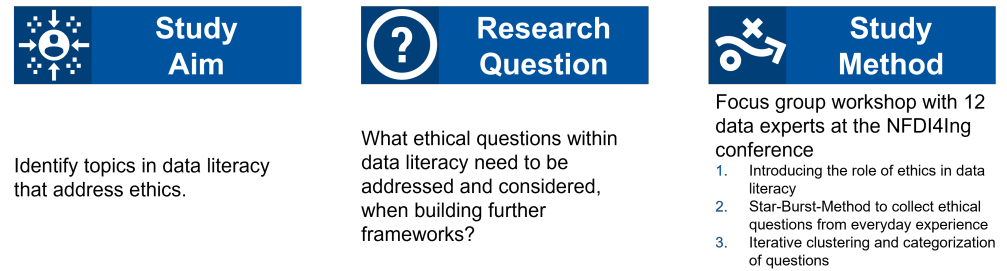

71 Closest to concrete examples in ethics is the research team around Giese. They introduce ethics  
72 as part of the transparency and awareness pillar [9]. This pillar is one of three other pillars and  
73 additionally includes a law and technical component. The ethical pillar in the concept of Giese  
74 et al. was introduced through real-world examples and thinking and pairing exercises [9].

75 In their example, they introduce a case from twitter, which indicates the importance of (social)  
76 media understanding, when it comes to ethics in data literacy. The example of Giese's application  
77 of ethics reveals that ethics within data literacy is often connected to other literacy types. This  
78 might be the reason why Schüller et al.frameworks introduce ethics as an additional literacy in  
79 their concept.

80 Ethical considerations in data literacy should be seen as a core element for all subsequent decision  
81 making. They should not merely be applied at some point in the process, but always remain in the  
82 core of a data literacy concept. Regardless of the data processing step aside from the *how* there  
83 should always also be the question of the *why*. As ethical questions require the consideration of  
84 a wide range of stakeholders and other fields, therefore ethical questions are usually overlapping  
85 with other literacy concepts.

### 86 **3 Method focus group study**

87 To answer the research question concerning the content of the ethic topics, a focus group study  
88 with data literacy experts and professionals was conducted. Focus group studies are a qualitative  
89 discourse method in which a group is stimulated to discuss a specific topic [15]. While the  
90 researchers provide a specific focus, such as ethics in data processing, the data is collected  
91 through the observation of a groups response through this topics. According to Kitzinger, this  
92 method is used to generate and explore questions among a group and encourage the development  
93 of their own analysis of common experiences [16]. While this method might not give a deep  
94 insight into individual perspectives and experiences [15], it is well suited to identify norms and  
95 values based on a common experience within a group [16].

**Figure 1:** Overview on focus group study design

96 Therefore, this method has been selected to gain a further understanding of ethical issues among  
 97 a group of data experts (see figure 1). Due to being a complex topic, ethical problems are a  
 98 helpful to identify shared experiences in the decision making process of data. Through the  
 99 discussion in groups, the individuals might find solutions or at least see that there are patterns to  
 100 their experienced dilemma. This is helpful for developing a collection of applied ethic topics  
 101 that go beyond the usual questions of data privacy.

102 The focus group study was conducted at the NFDI4Ing conference in October 2022 to a group of  
 103 15 participants with various background in mechanical engineering, information science and  
 104 software engineering. After defining ethics and their relation to data literacy, the starburst method  
 105 was introduced to collect ethical questions from the experts in smaller rotating groups.

106 The star bursting method is a method in design thinking to collect questions in order to understand  
 107 a problem from different perspectives [17]. In this method a star with six spikes represents six  
 108 question words (how, who, why, what, when and where). The task for the participants is to  
 109 reflect and fill the question words with ethical questions they have faced in their professional  
 110 work with data.

111 The group was divided into two groups and asked to collect and discuss ethical question based  
 112 on the six question words. The idea behind the ethical questions was not focused on finding  
 113 solutions at this point, as it is the nature of such questions to not be easily answerable from the  
 114 point of one domain. Rather, this collection was useful in understanding the spectrum of ethical  
 115 questions and the contexts that need to be considered when working with data. These questions  
 116 were subsequently anonymized and categorized and are presented in the following part.

117 The categorization of the questions was conducted with an iterative open coding method following  
 118 the grounded theory method. The grounded theory is a research method and approach towards data  
 119 for generating theories of medium range [18]. While the application of grounded theory would  
 120 have exceeded the analysis of the focus groups study, the iterative proceeding of summarizing,  
 121 coding and categorizing to identify a core image was implemented [18].

### 122 3.1 Results of the focus group study - categorizing data ethics

123 Through this study around 20 ethical questions in data focused research were collected among the  
 124 experts. While the explicit answering of these questions was not the aim of the study, the different  
 125 considerations help to gain an understanding of ethical aspects that need to be considered when  
 126 addressing ethical questions in data literacy.

**Figure 2:** Overview on categorized results of focus groups study

127 The ethical questions were summarized in the following six categories (See figure 2): the appli-  
 128 cation of the FAIR Principles (4), Stakeholders (4), Role of Authorities (3), Data Representation  
 129 (3), ethical problems and Examples (3), and a category consisting of questions that did not fit the  
 130 other categories (2).

131 The clustering of the categories in human oriented and process oriented describes whether the  
 132 questions address data interaction processes or reflect context in which data is processes. Process  
 133 oriented are ethical question that address the interactions with data along a data management  
 134 process of gathering, analyzing, visualization and documentation. Human centered questions are  
 135 addressing different stakeholders interacting with or through the results and decision-making  
 136 through data.

137 The FAIR principles are findability, accessibility, interoperability, and reusability (FAIR) [14].  
 138 An example question based on these principles was *'When should data transparency be given  
 139 and when is it too much?'*. As transparency is an underlying theme and the central aim of the  
 140 FAIR principles, this question addresses an important decision that people working with data are  
 141 considered daily.

142 The Stakeholder category reflects different groups that are affected by data-based applications.  
 143 The question pair reflecting this is *'Who might struggle with such ethical standards?'* and *'Who  
 144 would mainly benefit from such ethical standards?'*. This category has an overlap with both the  
 145 role of authorities and data representation categories.

146 The role of authorities has evolved around the power that states and companies hold. An example  
 147 question here was, *'Where can I turn to with an ethical problem in data?'* in combination with  
 148 *'Who could have the responsibility for deploying ethical standards in different application areas  
 149 (e.g. research, practice)?'*. This is more of a meta-category describing the organization of ethics  
 150 rather than their application, which is reflected more in the Stakeholder category. It might be a  
 151 subcategory of the Stakeholder category but is presented here as a separate category due to the  
 152 amount of questions that arise in the discussion.

153 Data Representation overlaps with Stakeholders and includes questions like *'What can we do  
 154 against misinterpretation of data?'* and *'How can we show that data representation reflects the*

155 *truth?*'. This category is strongly connected to practical guidelines in design and visualization.  
156 As the visualization of data is closely connected to visual and media literacy, those ideas might  
157 be found in overlapping areas of the other literacies.

158 The ethical problems and Examples category collected questions from concrete, applied examples  
159 in daily life. An example question for the category is '*How can we detect bias in data?*'.  
160 The further collection of examples would be helpful for a concrete design of an educational  
161 curriculum, as this category tends to become more specific than the others. There were further  
162 ethical questions that were sorted into the remaining collected category, such as '*When should*  
163 *data literacy and ethical maturity be taught?*', which is more oriented towards education, and  
164 '*How could Ethics impede data content generation?*' as further practical ethics questions. As  
165 this is a first attempt to address the variety of ethical questions in data management, further focus  
166 studies might develop further categories based on those questions.

167 Finally, in a reflection and feedback round of the study, the exchange gave new insights for  
168 the group as well as for the data. The biggest downside addressed by the group was that this  
169 exchange was too short and could have been extended further. Still, the collected categories  
170 extend current ethics in data literacy with a collection of topics that professionals recently face.

171 For the design of educational frameworks this suggests that ethics in data literacy is both human  
172 centered and process oriented. Ethics is present through the full data management cycle. Along  
173 with the known FAIR Principles the perspective of different stakeholders and identification of  
174 authorities in ethical problems are relevant to teach about data ethics. Also the question about  
175 the limitations of representing and suggesting truths in your own data set are suitable reflecting  
176 questions. Further applications of those results need to be tested further.

#### 177 **4 Conclusion and outlook**

178 This paper aims to broaden the understanding of data literacy by including discussions and  
179 critiques from media literacy into the development of a data literacy framework. This approach,  
180 with a literature review on how ethics is applied in combination with a focus group study among  
181 data literacy experts, can be seen as a first step towards developing ethical foundations in literacy  
182 frameworks that go beyond data privacy discussions.

183 In order to address the research questions:

- 184 • What ethical questions are present with data experts and should therefore be addressed  
185 and considered as examples, when applying data literacy frameworks?

186 First a literature study compared how different data literacy concepts applied ethics in their  
187 frameworks. As a result, it became clear that ethics is often seen as important but is rarely  
188 prominently applied. Additionally, it was concluded that applied reflection of ethical questions  
189 needs to include multiple perspectives. Still, the shift of ethics into the center is required, as  
190 ethical considerations are not limited to one scientific field.

191 To fill ethics in data literacy, a focus group study was conducted among data literacy experts  
192 at the NFDI4Ing conference in October 2022. Through an online workshop around 20 ethical  
193 questions were collected, categorized, and introduced (see figure 1). The main categories are the

194 Application of FAIR Principles, Stakeholders, Role of Authorities, Data Representation, ethical  
195 problems and Examples (see figure 2). These questions give further insights into themes that  
196 ethical programs in Data literacy apply and which are worth further examination.

197 As a next step, the scientific exchange between different literacy framework is highly recom-  
198 mended. Some of the collected ethical questions overlap other scientific fields such as media or  
199 sustainability literacy. Through further interdisciplinary exchange, data literacy will empower  
200 professionals, students and educators to make informed data-based decisions. First steps in  
201 this direction have already been achieved in february 2024 by an Ethics Working Group of the  
202 ELSA-section in the NFDI [19]. They had been established to ensure that ethical considerations  
203 are integrated into every aspect of research data practices and aim at addressing the complex  
204 ethical issues associated with research data management.

## 205 5 Annex - Table

Category	Definition	Questions
Application of FAIR Principles	Questions that are related to the FAIR Principles in either pointing towards an answer or giving guidelines for those questions. The FAIR Principles are findability, accessibility, interoperability, and reusability (FAIR).	<ul style="list-style-type: none"> <li>- How can I discern how long my research data must remain in the area of confidentiality until we have safeguarded the internal scientific process of gaining knowledge?</li> <li>- Where should data be stored? Is only EU really applicable?</li> <li>- When should data transparency be given and when is it too much?</li> <li>- Who would have the responsibility for the implementation of FAIR principles?</li> </ul>
Data Representation	Data Representation describe questions that evolve around rules for visualizing and representing data without misleading implications.	<ul style="list-style-type: none"> <li>- Why should ethical aspects influence data visibility?</li> <li>- What can we do against misinterpretation of data?</li> <li>- How can we visualize the truth (data visualization)?</li> </ul>
Meta Questions	This category collects questions that are discussing the (teaching) methods behind ethics in data literacy.	<ul style="list-style-type: none"> <li>- How could ethics impede data content generation?</li> <li>- How can we distinguish between ethical methods and ethical data content?</li> <li>- When should data literacy and ethical maturity be taught? - is this a topic that needs to be started in primary school and WHEN should the levels be deepened?</li> </ul>

Examples of ethical problems	The ethical problems and Examples category collected questions from concrete, applied examples in daily life.	<ul style="list-style-type: none"> <li>- How can we detect bias in data?</li> <li>- How have ethical considerations evolved over time and how do we address research subjects that are no longer up to date from an ethical point of view?</li> <li>- What are good examples for ethical questions in data literacy?</li> <li>- Where can I turn to with an ethical problem?</li> </ul>
Stakeholders	The Stakeholder category reflects different groups that are affected by data-based applications.	<ul style="list-style-type: none"> <li>Who would be mainly affected by such ethical standards?</li> <li>- Who might struggle with such ethical standards?</li> <li>- Who would mainly benefit from such ethical standards?</li> <li>- Who are the stakeholders and what requirements do they have?</li> </ul>
Role of Authorities	The role of authorities evolves reflections on entities that give authority in ethical questions.	<ul style="list-style-type: none"> <li>Who is the authority for ethical standards?</li> <li>- Where can I turn to with an ethical problem?</li> <li>- Who could have the responsibility for deploying ethical standards in different application areas (e.g. research, practice)?</li> </ul>

**Table 1:** Table showing how questions are defined and categorized

## 206 6 Acknowledgements

207 This paper would not be possible without opportunity to conduct a workshop at the NIDI4Ing  
 208 conference 2022. The authors thank the participants of the workshop for their active and engaged  
 209 contribution to the ethical questions, insights in the ethical dilemmas they have faced in their  
 210 professional life and the open exchange on eye-level.
